

Wafer Dual Door Check Valve

 A GFT COMPANY

1CD Series

- The 1CD series Wafer Dual Door Check Valve offers a one piece body constructed per API 594 standards. The body is completely isolated from external leakage. All shafts and plates are internally retained by utilizing an upper and lower retainer. Set screws secure these retainers during transportation and installation. After installation is complete, the flanges prevent the retainers from moving.

- Rubber seats are installed using an innovative bonding process assuring seat stability under higher pressure and vacuum service. Metal seats are integral to the valve body. Many Alloy seat materials are available as well as several hard facing options such as Stellite #6 and Stellite #21. All 1CD series valves utilize a seat design that maintains complete seat seal contact with both plates. By lapping the sealing surface of the plates and metal seats, customers can be confident the ABZ 1CD check valve will maintain a positive seal under low and high pressures.

- Corrosion resistant torsion springs are used to assist in valve closure. 1CD series torsion springs are designed with extension arms that apply pressure to precise areas of the plates assuring an even sealing against seats.

- The 1CD series shaft is heavy duty and corrosion resistant allowing full support of the disc plates under high velocity flow as well as high pressure closure.

- Thrust washers are used between all moving wear points to reduce friction and wear.

- The 1CD series valve offers a broad range of materials allowing customers to select a valve construction that best suits the application.

- Size range = 2" – 36" ANSI 125, 150 & 300

Sizes
2" - 36"
